# Package 'ROntoTools'

December 11, 2024

**Type** Package

**Title** R Onto-Tools suite

**Version** 2.35.0

**Author** Calin Voichita <calin@wayne.edu> and Sahar Ansari
<saharansari@wayne.edu> and Sorin Draghici <sorin@advaitabio.com>

**Maintainer** Sorin Draghici <sorin@advaitabio.com>

**Description** Suite of tools for functional analysis.

**biocViews** NetworkAnalysis, Microarray, GraphsAndNetworks

**License** CC BY-NC-ND 4.0 + file LICENSE

**Depends** methods, graph, boot, KEGGREST, KEGGgraph, Rgraphviz

**Suggests** RUnit, BiocGenerics

**RoxygenNote** 5.0.1

**git_url** https://git.bioconductor.org/packages/ROntoTools

**git_branch** devel

**git_last_commit** d2b826d

**git_last_commit_date** 2024-10-29

**Repository** Bioconductor 3.21

**Date/Publication** 2024-12-10

# Contents

alpha1MR                        *Compute alpha weights*

## Description

Transform a vector of p-values into weights.

## Usage

```
alpha1MR(pv, threshold = max(pv))
```

## Arguments

pv              vector of p-values

threshold       the threshold value that was used to select DE genes

## Details

Computes a set of weights from p-values using the formula `1-pv/threshold`.

## Author(s)

Calin Voichita and Sorin Draghici

## See Also

[pe](pe)

## Examples

```
load(system.file("extdata/E-GEOD-21942.topTable.RData", package = "ROntoTools"))

head(alpha1MR(top$adj.P.Val))
```

---

alphaMLG                    *Compute alpha weights*

---

## Description

Transform a vector of p-values into weights.

## Usage

```
alphaMLG(pv, threshold = max(pv))
```

## Arguments

pv              vector of p-values

threshold       the threshold value that was used to select DE genes

## Details

Computes a set of weights from p-values using the formula `-log10(pv/threshold)`.

## Author(s)

Calin Voichita and Sorin Draghici

## See Also

[pe](#)

## Examples

```
load(system.file("extdata/E-GEOD-21942.topTable.RData", package = "ROntoTools"))

head(alphaMLG(top$adj.P.Val))
```

---

| compute.fisher | *Combine independent p-values using the Fisher method* |

---

### Description

Combine independent p-values using the Fisher method

### Usage

```
compute.fisher(p, eps = 1e-06)
```

### Arguments

| | |
|---|---|
| p | a vector of independent p-values |
| eps | the minimal p-value considered (all p-values smaller will be set to this value) |

### Value

the combined p-value

### Author(s)

Calin Voichita and Sorin Draghici

### References

Tarca AL., Draghici S., Khatri P., Hassan SS., Kim J., Kim CJ., Kusanovic JP., Romero R.: "A Signaling Pathway Impact Analysis for Microarray Experiments", 2008, Bioinformatics, 2009, 25(1):75-82.

### See Also

pe,compute.normalInv

### Examples

```
p <- c(.1, .01)
compute.fisher(p)
```

---

compute.normalInv      *Combine independent p-values using the normal inversion method*

---

### Description

Combine independent p-values using the normal inversion method

### Usage

```
compute.normalInv(p, eps = 1e-06)
```

### Arguments

| | |
|---|---|
| p | a vector of independent p-values |
| eps | the minimal p-value considered (all p-values smaller will be set to this value) |

### Value

the combined p-value

### Author(s)

Calin Voichita and Sorin Draghici

### References

### Examples

```
p <- c(.1, .01)
compute.normalInv(p)
```

---

KEGGpathway2Graph          *Modified version of the same function from KEGGgraph*

---

### Description

Modified version of the same function from KEGGgraph

### Usage

```
KEGGpathway2Graph(pathway, genesOnly = TRUE, expandGenes = TRUE)
```

---

keggPathwayGraphs          *Download and parse KEGG pathway data*

---

### Description

Download and parse KEGG pathway data

### Usage

```
keggPathwayGraphs(organism = "hsa", targRelTypes = c("GErel", "PCrel",
  "PPrel"), relPercThresh = 0.9, nodeOnlyGraphs = FALSE,
  updateCache = FALSE, verbose = TRUE)
```

### Arguments

| | |
|---|---|
| organism | organism code as defined by KEGG |
| targRelTypes | target relation types |
| relPercThresh | percentage of the number of relation types over all possible realtions in the pathway |
| nodeOnlyGraphs | allow graphs with no edges |
| updateCache | re-download KEGG data |
| verbose | show progress of downloading and parsing |

### Value

A list of [graphNEL](#) objects encoding the pathway information.

### Author(s)

Calin Voichita and Sorin Draghici

### See Also

[keggPathwayNames](#)

## Examples

```
# The pathway cache provided as part of the pathway contains only the
# pathways that passed the default filtering. We recommend, re-downloading
# the pathways using the updateCache parameter
kpg <- keggPathwayGraphs("hsa")

# to update the pathway cache for human run:
# kpg <- keggPathwayGraphs("hsa", updateCache = TRUE)
# this is time consuming and depends on the available bandwith.

head(names(kpg))

kpg[["path:hsa04110"]]
head(nodes(kpg[["path:hsa04110"]]))
head(edges(kpg[["path:hsa04110"]]))
```

---

keggPathwayNames            *Obtain KEGG pathway titles*

---

## Description

Obtain KEGG pathway titles

## Usage

```
keggPathwayNames(organism = "hsa", updateCache = FALSE, verbose = TRUE)
```

## Arguments

| | |
|---|---|
| organism | organism code as defined by KEGG |
| updateCache | re-download KEGG data |
| verbose | show progress of downloading and parsing |

## Value

A named vector of pathway titles. The names of the vector are the pathway KEGG IDs.

## Author(s)

Calin Voichita and Sorin Draghici

## See Also

[keggPathwayGraphs](keggPathwayGraphs)

## Examples

```
kpn <- keggPathwayNames("hsa")

# to update the pathway cache for human run:
# kpn <- keggPathwayNames("hsa", updateCache = TRUE)
# this is time consuming and depends on the available bandwidth.

head(kpn)
```

---

nodeWeights                         *Retrieve the node weights of a graph*

---

## Description

A generic function that returns the node weights of a graph. If index is specified, only the weights of the specified nodes are returned. The user can control which node attribute is interpreted as the weight.

## Usage

```
nodeWeights(object, index, ..., attr = "weight", default = 1)

## S4 method for signature 'graph,character'
nodeWeights(object, index, attr, default)

## S4 method for signature 'graph,numeric'
nodeWeights(object, index, attr, default)

## S4 method for signature 'graph,missing'
nodeWeights(object, index, attr, default)
```

## Arguments

| | |
|---|---|
| object | A graph, any object that inherits the graph class. |
| index | If supplied, a character or numeric vector of node names or indices. |
| ... | Unused. |
| attr | The name of the node attribute to use as a weight. You can view the list of defined node attributes and their default values using nodeDataDefaults. |
| default | The value to use if object has no node attribute named by the value of attr. The default is the value 1. |

## Details

The weights of all nodes identified by the index are returned. If index is not supplied, the weights of all nodes are returned.

By default, nodeWeights looks for an node attribute with name "weight" and, if found, uses these values to construct the node weight vector. You can make use of attributes stored under a different name by providing a value for the attr argument. For example, if object is a graph instance with an node attribute named "WTS", then the call nodeWeights(object, attr="WTS") will attempt to use those values.

If the graph instance does not have an node attribute with name given by the value of the attr argument, default will be used as the weight for all nodes. Note that if there is an attribute named by attr, then its default value will be used for nodes not specifically customized. See nodeData and nodeDataDefaults for more information.

## Value

A named vector with the node weights. The names of the vector are the names of the specified index, or all nodes if index was not provided.

## Author(s)

Calin Voichita and Sorin Draghici

## See Also

nodes, nodeData

## Examples

```
library(graph)
V <- LETTERS[1:4]
g <- graphNEL(nodes = V, edgemode = "directed")
nodeWeights(g)
nodeWeights(g, "B")
nodeWeights(g, attr = "WT", default = 3)
```

---

| pDis | *Primary dis-regulation: Pathway analysis approach based on the un-explained dis-regulation of genes* |
|------|------|

---

## Description

Primary dis-regulation: Pathway analysis approach based on the unexplained dis-regulation of genes

## Usage

```
pDis(x, graphs, ref = NULL, nboot = 2000, verbose = TRUE,
  cluster = NULL, seed = NULL)
```

## Arguments

| | |
|---|---|
| x | named vector of log fold changes for the differentially expressed genes; names(x) must use the same id's as ref and the nodes of the graphs |
| graphs | list of pathway graphs as objects of type graph (e.g., graphNEL); the graphs must be weighted graphs (i.e., have an attribute weight for both nodes and edges) |
| ref | the reference vector for all genes in the analysis; if the reference is not provided or it is identical to names(x) a cut-off free analysis is performed |
| nboot | number of bootstrap iterations |
| verbose | print progress output |
| cluster | a cluster object created by makeCluster for parallel computations |
| seed | an integer value passed to set.seed() during the boostrap permutations |

## Details

See details in the cited articles.

## Value

An object of class pDisRes-class.

## Author(s)

Calin Voichita, Sahar Ansari and Sorin Draghici

## References

Voichita C., Donato M., Draghici S.: "Incorporating gene significance in the impact analysis of signaling pathways", IEEE Machine Learning and Applications (ICMLA), 2012 11th International Conference on, Vol. 1, p.126-131, 2012 Ansari, S., Voichita, C., Donato, M., Tagett, R., & Draghici, S. ## Examples

```
# load a multiple sclerosis study (public data available in Array Express
# ID: E-GEOD-21942)
# This file contains the top table, produced by the limma package with
# added gene information. All the probe sets with no gene associate to them,
# have been removed. Only the most significant probe set for each gene has been
# kept (the table is already ordered by p-value)
```

```
# The table contains the expression fold change and signficance of each
# probe set in peripheral blood mononuclear cells (PBMC) from 12 MS patients
# and 15 controls.
load(system.file("extdata/E-GEOD-21942.topTable.RData", package = "ROntoTools"))
head(top)

# select differentially expressed genes at 1% and save their fold change in a
# vector fc and their p-values in a vector pv
fc <- top$logFC[top$adj.P.Val <= .01]
names(fc) <- top$entrez[top$adj.P.Val <= .01]

pv <- top$P.Value[top$adj.P.Val <= .01]
names(pv) <- top$entrez[top$adj.P.Val <= .01]

# alternativly use all the genes for the analysis
# NOT RUN:
# fc <- top$logFC
# names(fc) <- top$entrez

# pv <- top$P.Value
# names(pv) <- top$entrez

# get the reference
ref <- top$entrez

# load the set of pathways
kpg <- keggPathwayGraphs("hsa")

# set the beta information (see the cited documents for meaning of beta)
kpg <- setEdgeWeights(kpg)

# inlcude the significance information in the analysis (see Voichita:2012
# for more information)
# set the alpha information based on the pv with one of the predefined methods
kpg <- setNodeWeights(kpg, weights = alphaMLG(pv), defaultWeight = 1)

# perform the pathway analysis
# in order to obtain accurate results the number of boostraps, nboot, should
# be increase to a number like 2000
pDisRes <- pDis(fc, graphs = kpg, ref = ref, nboot = 100, verbose = TRUE)

# obtain summary of results
head(Summary(pDisRes))
```

---

pDisPathway-class          *Class that encodes the result of pDis analysis for a single pathway*

---

## Description

Class that encodes the result of pDis analysis for a single pathway

**Slots**

map: an object of type graph (e.g., `graphNEL`).

input: named vector of fold changes for genes on this pathway. The names of the genes are the orignal IDS used in the analysis

ref: vector of reference IDs on this pathway

boot: an object of class boot encoding the bootstrap information.

pDis: the gene primary dis-regulation for all genes on the pathway, as computed by primary dis-regulation.

asGS: pathway was considered as gene set

**Author(s)**

Calin Voichita, Sahar Ansari and Sorin Draghici

**See Also**

`pDis`, `pDisRes-class`

---

pDisRes-class           *Primary dis-regulation (pDis) result class*

---

**Description**

This class is used to encode the results of the pathway analysis performed by the function `pDis`.

**Details**

The slots input and ref record global information related to the whole analysis, while the pathways slot records the specific results as `pDisPathway-class` for each one of the pathways used in the analysis.

**Slots**

pathways: A list of `pDisPathway-class` objects.

input: named vector of fold changes used for the analysis. The names of the vector are the IDs originaly used.

ref: character vector containing the IDs used as reference in the analysis.

cutOffFree: boolean value indicating if a cut-of-free analysis has been performed.

**Author(s)**

Calin Voichita, Sahar Ansari and Sorin Draghici

**See Also**

`pDis`, `pDisPathway-class`

pe | *Pathway-Express: Pathway analysis of signaling pathways*

---

### Description

Pathway-Express: Pathway analysis of signaling pathways

### Usage

```
pe(x, graphs, ref = NULL, nboot = 2000, verbose = TRUE, cluster = NULL,
   seed = NULL)
```

### Arguments

| | |
|---|---|
| x | named vector of log fold changes for the differentially expressed genes; names(x) must use the same id's as ref and the nodes of the graphs |
| graphs | list of pathway graphs as objects of type graph (e.g., graphNEL); the graphs must be weighted graphs (i.e., have an attribute weight for both nodes and edges) |
| ref | the reference vector for all genes in the analysis; if the reference is not provided or it is identical to names(x) a cut-off free analysis is performed |
| nboot | number of bootstrap iterations |
| verbose | print progress output |
| cluster | a cluster object created by makeCluster for parallel computations |
| seed | an integer value passed to set.seed() during the boostrap permutations |

### Details

See details in the cited articles.

### Value

An object of class peRes-class.

### Author(s)

Calin Voichita and Sorin Draghici

```

---

peEdgeRenderInfo         *Extract edge render information from a* pePathway-class *object*

---

### Description

Extract edge render information from a pePathway-class object

### Usage

```
peEdgeRenderInfo(x, pos.col = "black", pos.lty = "solid", pos.ah = "vee",
  neg.col = "black", neg.lty = "dashed", neg.ah = "tee",
  zero.col = "lightgray", zero.lty = "dotted", zero.ah = "none")
```

### Arguments

| | |
|---|---|
| x | an object of class [pePathway-class](#) |
| pos.col | color of the edges with possitive weight |
| pos.lty | line type of the edges with possitive weight |
| pos.ah | arrow head of the edges with possitive weight |
| neg.col | color of the edges with negative weight |
| neg.lty | line type of the edges with negative weight |
| neg.ah | arrow head of the edges with negative weight |
| zero.col | color of the edges with zero weight |
| zero.lty | color of the edges with zero weight |
| zero.ah | color of the edges with zero weight |

### Value

a named list as expected by [edgeRenderInfo](#)

### Author(s)

Calin Voichita and Sorin Draghici

**See Also**

edgeRenderInfo,par

**Examples**

```
# load experiment
load(system.file("extdata/E-GEOD-21942.topTable.RData", package = "ROntoTools"))
fc <- top$logFC[top$adj.P.Val <= .01]
names(fc) <- top$entrez[top$adj.P.Val <= .01]
ref <- top$entrez

# load the set of pathways
kpg <- keggPathwayGraphs("hsa")
kpg <- setEdgeWeights(kpg)
kpg <- setNodeWeights(kpg, defaultWeight = 1)

# perform the pathway analysis
peRes <- pe(fc, graphs = kpg, ref = ref, nboot = 100, verbose = TRUE)

p <- peRes@pathways[[50]]
g <- layoutGraph(p@map, layoutType = "dot")
graphRenderInfo(g) <- list(fixedsize = FALSE)
edgeRenderInfo(g) <- peEdgeRenderInfo(p)
nodeRenderInfo(g) <- peNodeRenderInfo(p)
# notice the different type of edges in the graph (solid/dashed/dotted)
renderGraph(g)
```

---

peNodeRenderInfo                  *Extract node render information from a* pePathway-class *object*

---

**Description**

Extract node render information from a pePathway-class object

**Usage**

```
peNodeRenderInfo(x, y = "Pert", input.shape = "box",
  default.shape = "ellipse", pos.col = "red", neg.col = "blue",
  zero.col = "white")
```

**Arguments**

| | |
|---|---|
| x | an object of class pePathway-class |
| y | a string representing the factor to be represented (Pert, Acc or input; see pePathway-class) |
| input.shape | shape of nodes that have measured expression change |
| default.shape | shape of all other nodes |

| pos.col | color of nodes with a positive y factor |
| neg.col | color of nodes with a negative y factor |
| zero.col | color of nodes with the y factor equal to zero |

## Value

a named list as expected by nodeRenderInfo

## Author(s)

Calin Voichita and Sorin Draghici

## See Also

nodeRenderInfo,par

## Examples

```
# load experiment
load(system.file("extdata/E-GEOD-21942.topTable.RData", package = "ROntoTools"))
fc <- top$logFC[top$adj.P.Val <= .01]
names(fc) <- top$entrez[top$adj.P.Val <= .01]
ref <- top$entrez

# load the set of pathways
kpg <- keggPathwayGraphs("hsa")
kpg <- setEdgeWeights(kpg)
kpg <- setNodeWeights(kpg, defaultWeight = 1)

# perform the pathway analysis
peRes <- pe(fc, graphs = kpg, ref = ref, nboot = 100, verbose = TRUE)

p <- peRes@pathways[[50]]
g <- layoutGraph(p@map, layoutType = "dot")
graphRenderInfo(g) <- list(fixedsize = FALSE)
edgeRenderInfo(g) <- peEdgeRenderInfo(p)
nodeRenderInfo(g) <- peNodeRenderInfo(p)
# notice the different type of nodes in the graph (box/circle)
# the color of each node represents the perturbation (red = positive, blue = negative)
# the shade represents the stregth of the perturbation
renderGraph(g)

nodeRenderInfo(g) <- peNodeRenderInfo(p, "Acc")
# now, the color of each node represents the accumulation (red = positive, blue = negative)
# notice that square nodes with no parents have no accumulation
renderGraph(g)
```

---

pePathway-class *Class that encodes the result of Pathway-Express for a single pathway*

---

### Description

Class that encodes the result of Pathway-Express for a single pathway

### Slots

map: an object of type graph (e.g., graphNEL).

input: named vector of fold changes for genes on this pathway. The names of the genes are the orignal IDS used in the analysis

ref: vector of reference IDs on this pathway

boot: an object of class boot encoding the bootstrap information.

Pert: the gene perturbation factors for all genes on the pathway, as computed by Pathway-Express.

Acc: the gene accumulations for all genes on the pathway, as computed by Pathway-Express.

asGS: pathway was considered as gene set

### Author(s)

Calin Voichita and Sorin Draghici

### See Also

pe, peRes-class

---

peRes-class *Pathway-Express result class*

---

### Description

This class is used to encode the results of the pathway analysis performed by the function pe.

### Details

The slots input and ref record global information related to the whole analysis, while the pathways slot records the specific results as pePathway-class for each one of the pathways used in the analysis.

### Slots

pathways: A list of pePathway-class objects.

input: named vector of fold changes used for the analysis. The names of the vector are the IDs originaly used.

ref: character vector containing the IDs used as reference in the analysis.

cutOffFree: boolean value indicating if a cut-of-free analysis has been performed.

## Author(s)

## See Also

pe, pePathway-class

---

```
plot,pePathway,missing-method
```
*Plot pathway level statistics*

---

## Description

Display graphical representation of pathway level statistic like: i) two way comparison between the measured expression change and one of the factors computed by Pathway-Express (pe) or ii) the boostrap statistics of the same factors.

## Usage

```
## S4 method for signature 'pePathway,missing'
plot(x, y, ..., type = "two.way", eps = 1e-06)

## S4 method for signature 'pePathway,character'
plot(x, y, main = "", ..., type = "two.way",
  eps = 1e-06)
```

## Arguments

| | |
|---|---|
| x | an object of type pePathway-class |
| y | if provided, the factor to be ploted (either Acc (default) or Pert; see pePathway-class) |
| ... | Arguments to be passed to methods, such as par |
| type | type of plot (either two.way (default) or boot) |
| eps | any value smaller than this will be ploted as 0 |
| main | title |

## Author(s)

Calin Voichita and Sorin Draghici

## See Also

## Examples

```
# load experiment
load(system.file("extdata/E-GEOD-21942.topTable.RData", package = "ROntoTools"))
fc <- top$logFC[top$adj.P.Val <= .01]
names(fc) <- top$entrez[top$adj.P.Val <= .01]
ref <- top$entrez

# load the set of pathways
kpg <- keggPathwayGraphs("hsa")
kpg <- setEdgeWeights(kpg)
kpg <- setNodeWeights(kpg, defaultWeight = 1)

# perform the pathway analysis (for more accurate results use nboot = 2000)
peRes <- pe(fc, graphs = kpg, ref = ref, nboot = 100, verbose = TRUE)

plot(peRes@pathways[[50]])

plot(peRes@pathways[[50]], "Pert", main = "Perturbation factor")

plot(peRes@pathways[[50]], type = "boot")

plot(peRes@pathways[[50]], "Pert", type = "boot", main = "Perturbation factor")
```

---

plot,peRes,missing-method

*Plot Pathway-Express result*

---

## Description

Display a two-way plot using two of the p-values from the Pathway-Express analysis.

## Usage

```
## S4 method for signature 'peRes,missing'
plot(x, y, ..., comb.pv.func = compute.fisher,
  adjust.method = "fdr", threshold = 0.05, eps = 1e-06)

## S4 method for signature 'peRes,character'
plot(x, y, ..., comb.pv.func = compute.fisher,
  adjust.method = "fdr", threshold = 0.05, eps = 1e-06)
```

## Arguments

| | |
|---|---|
| x | an object of type [peRes-class](#) |
| y | vector of two p-values names to be combined using comb.pv.func (default: c("pAcc", "pORA")). |
| ... | Arguments to be passed to methods, such as [par](#). |

| comb.pv.func | the function to combine the p-values - takes as input a vector of p-values and returns the combined p-value (default: `compute.fisher`). |
|---|---|
| adjust.method | the name of the method to adjust the p-value (see `p.adjust`) |
| threshold | corrected p-value threshold |
| eps | any value smaller than this will be considered as eps (default: `1e-6`). |

## Author(s)

## See Also

`pe`, `summary.peRes`, `plot,pePathway,missing-method`

## Examples

```
# load experiment
load(system.file("extdata/E-GEOD-21942.topTable.RData", package = "ROntoTools"))
fc <- top$logFC[top$adj.P.Val <= .01]
names(fc) <- top$entrez[top$adj.P.Val <= .01]
ref <- top$entrez

# load the set of pathways
kpg <- keggPathwayGraphs("hsa")
kpg <- setEdgeWeights(kpg)
kpg <- setNodeWeights(kpg, defaultWeight = 1)

# perform the pathway analysis (for more accurate results use nboot = 2000)
peRes <- pe(fc, graphs = kpg, ref = ref, nboot = 100, verbose = TRUE)

plot(peRes)

plot(peRes, c("pPert","pORA"), comb.pv.func = compute.normalInv, threshold = .01)
```

---

| setEdgeWeights | *Set gene weights based on edge type* |
|---|---|

---

## Description

`setEdgeWeights`

## Usage

```
setEdgeWeights(graphList, edgeTypeAttr = "subtype",
  edgeWeightByType = list(activation = 1, inhibition = -1, expression = 1,
  repression = -1), defaultWeight = 0, combineWeights = sum,
  nodeOnlyGraphs = FALSE)
```

## Arguments

graphList   a list of [graphNEL](#) objects

edgeTypeAttr  edge attribute to be considered as the edge type. If the edge has multiple types, the edge type attribute is considered as a comma separeted list of types

edgeWeightByType

      named list of weigths, where the names of the list are the edge type (values of the attribute defined by edgeTypeAttr)

defaultWeight  default value for an edge with a type not defined in edgeWeightByType

combineWeights for the edges with multiple types, the function to be applied on the vector of weights

nodeOnlyGraphs boolean value marking if graphs with no edges should be returned or not; note that graphs with all edge weights equal to 0 are considered node only graphs

## Value

The graphList with the edge weights set.

## Author(s)

Calin Voichita and Sorin Draghici

## Examples

```
# load the set of pathways
kpg <- keggPathwayGraphs("hsa")

kpg <- setEdgeWeights(kpg)

edgeWeights(kpg[["path:hsa04110"]])
```

---

setNodeWeights    *Set node weights*

---

## Description

Set node weights

## Usage

```
setNodeWeights(graphList, weights = NULL, defaultWeight = 1)
```

## Arguments

| | |
|---|---|
| graphList | a list of graph (e.g., graphNEL) objects |
| weights | named vector or matrix; if vector, the node is going to have the same weight in all graphs it appears; if matrix, the rows represent nodes and columns represent graphs and the node will have different weights in each pathway |
| defaultWeight | the default weight for all nodes not set by the parameter weights |

## Value

The graphList with the node weights set.

## Author(s)

Calin Voichita and Sorin Draghici

## Examples

```
# load the set of pathways
kpg <- keggPathwayGraphs("hsa")

kpg <- setNodeWeights(kpg)

nodeWeights(kpg[["path:hsa04110"]])
```

---

subGraphByNodeType    *Modified version of the same function from KEGGgraph*

---

## Description

Modified version of the same function from KEGGgraph

## Usage

```
subGraphByNodeType(graph, type = "gene")
```

Summary,pDisRes-method
*Summarize the results of a Pathway-Express analysis*

### Description

Summarize the results of a Pathway-Express analysis

### Usage

```
## S4 method for signature 'pDisRes'
Summary(x, ..., na.rm = FALSE)
```

### Arguments

x               Primary dis-regulation analysis result object obtained using [pDis](#)

...             see [summary.pDisRes](#)

na.rm           ignored

Summary,peRes-method     *Summarize the results of a Pathway-Express analysis*

### Description

Summarize the results of a Pathway-Express analysis

### Usage

```
## S4 method for signature 'peRes'
Summary(x, ..., na.rm = FALSE)
```

### Arguments

x               Pathway-Express analysis result object obtained using [pe](#)

...             see [summary.peRes](#)

na.rm           ignored

---

summary.pDisRes          *Summarize the results of a primary dis-regulation (pDis) analysis*

---

### Description

Summarize the results of a primary dis-regulation (pDis) analysis

### Usage

```
summary.pDisRes(object, ..., pathNames = NULL, totalpDis = TRUE, normalize = TRUE,
 ppDis = TRUE, pORA = TRUE,
 comb.pv = c("ppDis", "pORA"), comb.pv.func = compute.fisher,
 order.by = "pComb", adjust.method = "fdr")
```

### Arguments

| | |
|---|---|
| object | pDis analysis result object obtained using pDis |
| ... | ignored |
| pathNames | named vector of pathway names; the names of the vector are the IDs of the pathways |
| totalpDis | boolean value indicating if the total primary dis-regulation should be computed |
| normalize | boolean value indicating if normalization with regards to the boostrap simulations should be performed on totalpDis |
| ppDis | boolean value indicating if the significance of the total primary dis-regulation in regards to the bootstrap permutations should be computed |
| pORA | boolean value indicating if the over-represtation p-value should be computed |
| comb.pv | vector of the p-value names to be combine (any of the above p-values) |
| comb.pv.func | the function to combine the p-values; takes as input a vector of p-values and returns the combined p-value |
| order.by | the name of the p-value that is used to order the results |
| adjust.method | the name of the method to adjust the p-value (see p.adjust) |

### Examples

```
# load experiment
load(system.file("extdata/E-GEOD-21942.topTable.RData", package = "ROntoTools"))
fc <- top$logFC[top$adj.P.Val <= .01]
names(fc) <- top$entrez[top$adj.P.Val <= .01]
ref <- top$entrez

# load the set of pathways
```

```
kpg <- keggPathwayGraphs("hsa")
kpg <- setEdgeWeights(kpg)
kpg <- setNodeWeights(kpg, defaultWeight = 1)

# perform the pathway analysis
pDisRes <- pDis(fc, graphs = kpg, ref = ref, nboot = 100, verbose = TRUE)

# obtain summary of results
head(summary(pDisRes))

kpn <- keggPathwayNames("hsa")

head(summary(pDisRes))

head(summary(pDisRes, pathNames = kpn, totalpDis = FALSE,
             pORA = FALSE, comb.pv = NULL, order.by = "pDis"))
```

---

summary.peRes                 *Summarize the results of a Pathway-Express analysis*

---

### Description

Summarize the results of a Pathway-Express analysis

### Usage

```
summary.peRes(object, ..., pathNames = NULL, totalAcc = TRUE, totalPert = TRUE, normalize = TRUE,
 pPert = TRUE, pAcc = TRUE, pORA = TRUE,
 comb.pv = c("pPert", "pORA"), comb.pv.func = compute.fisher,
 order.by = "pComb", adjust.method = "fdr")
```

### Arguments

| | |
|---|---|
| object | Pathways-Express result object obtained using [pe](#) |
| ... | ignored |
| pathNames | named vector of pathway names; the names of the vector are the IDs of the pathways |
| totalAcc | boolean value indicating if the total accumulation should be computed |
| totalPert | boolean value indicating if the total perturbation should be computed |
| normalize | boolean value indicating if normalization with regards to the boostrap simulations should be performed on totalAcc and totalPert |
| pPert | boolean value indicating if the significance of the total perturbation in regards to the bootstrap permutations should be computed |
| pAcc | boolean value indicating if the significance of the total accumulation in regards to the bootstrap permutations should be computed |

| | |
|---|---|
| pORA | boolean value indicating if the over-represtation p-value should be computed |
| comb.pv | vector of the p-value names to be combine (any of the above p-values) |
| comb.pv.func | the function to combine the p-values; takes as input a vector of p-values and returns the combined p-value |
| order.by | the name of the p-value that is used to order the results |
| adjust.method | the name of the method to adjust the p-value (see p.adjust) |
